# Experiment-14

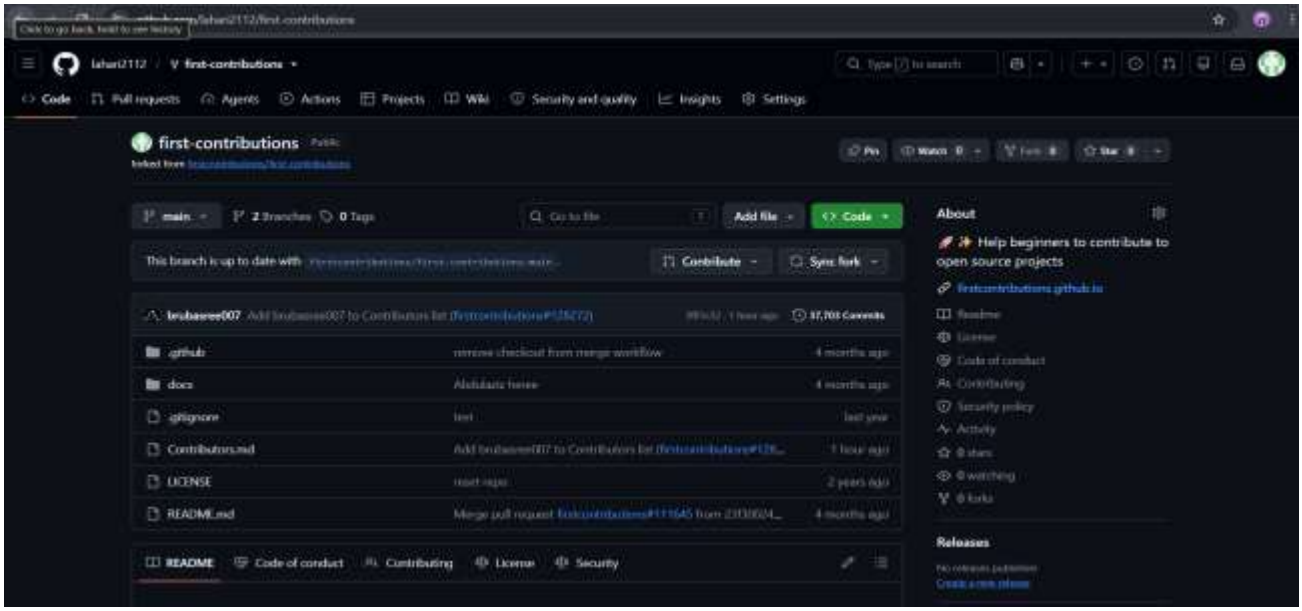

## FORK-AND-PULL-REQUEST COLLABORATION WORKFLOW USING GIT AND GITHUB

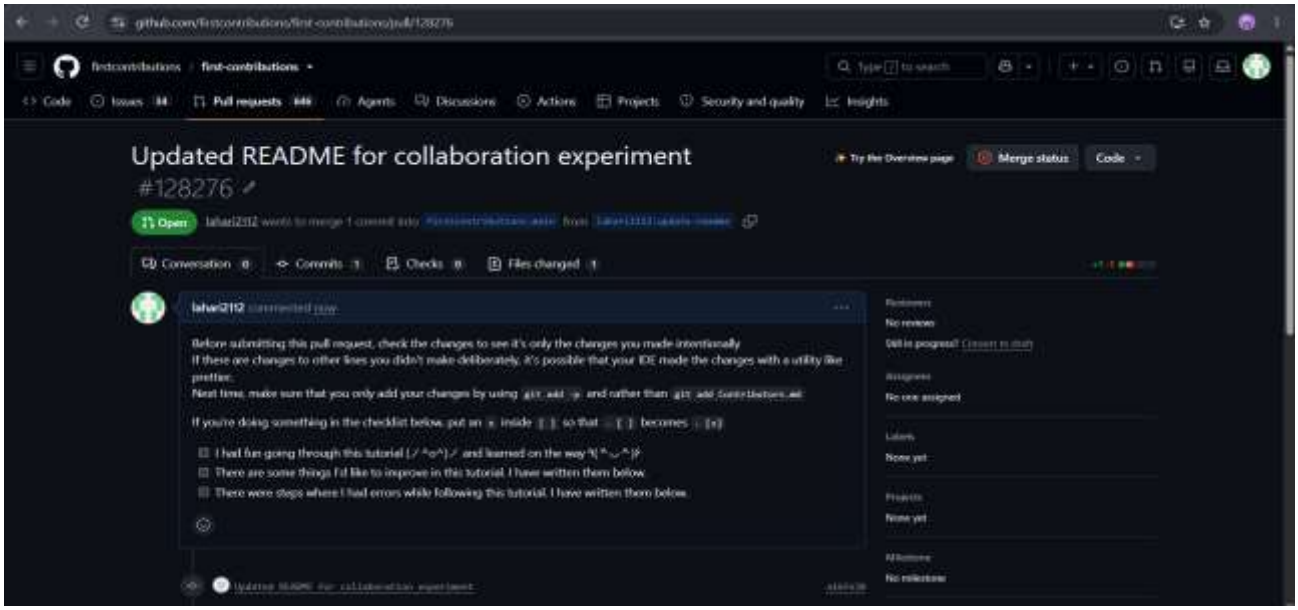

**AIM**

To collaborate on a GitHub project using the fork-and-pull-request workflow: fork a public repository, clone it, create a branch, make changes, push them and raise a pull request for review and merge.

**Procedure:**

1. Open GitHub and log in to your account.
2. Search for the repository you want to contribute to.
3. Click the **Fork** button to create a copy of the repository in your GitHub account.
4. Clone the forked repository to your local system using Git.
5. Create a new branch for making changes.
6. Modify the required files and save the changes.
7. Use Git commands to add and commit the changes.
8. Push the changes to your forked GitHub repository.
9. Open your forked repository on GitHub.
10. Click **Compare & Pull Request** to create a pull request.
11. Add a suitable title and description explaining the changes.
12. Click **Create Pull Request** to submit the changes for review.
13. The repository owner reviews the changes and can merge the pull request into the original repository.

**Result:**

Successfully performed the Fork-and-Pull-Request collaboration workflow using Git and GitHub. Changes were committed, pushed to the forked repository, and submitted through a pull request for review and merging.
