Experiment-15

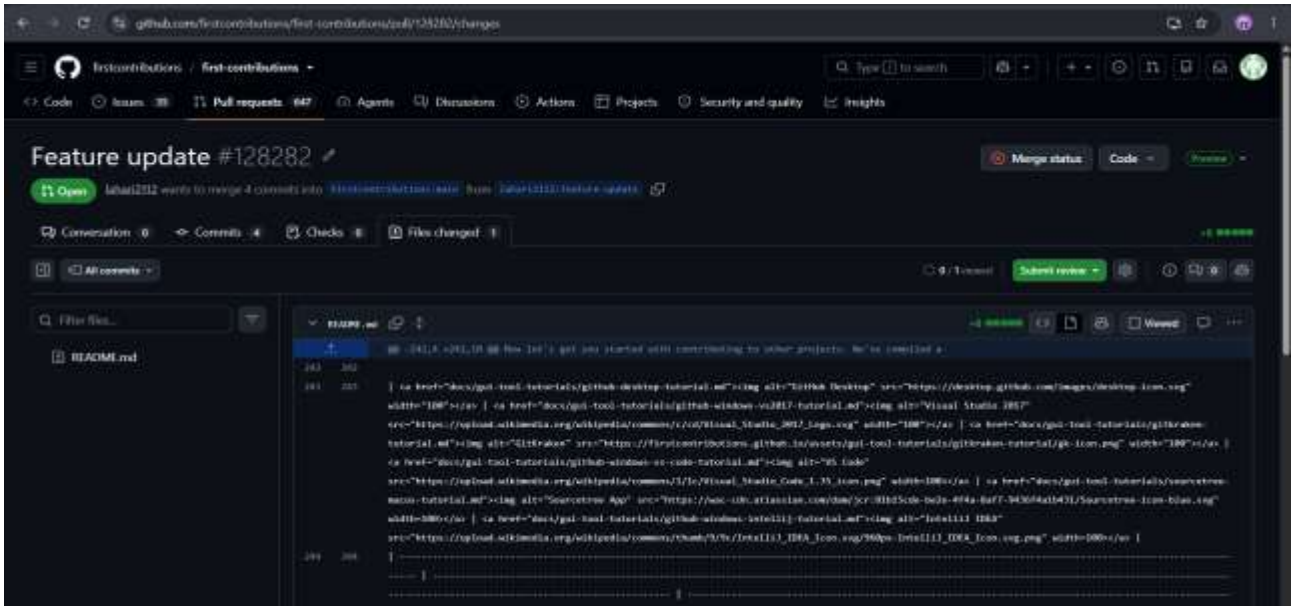

WORKING WITH GIT BRANCHES AND RESOLVING MERGE CONFLICTS

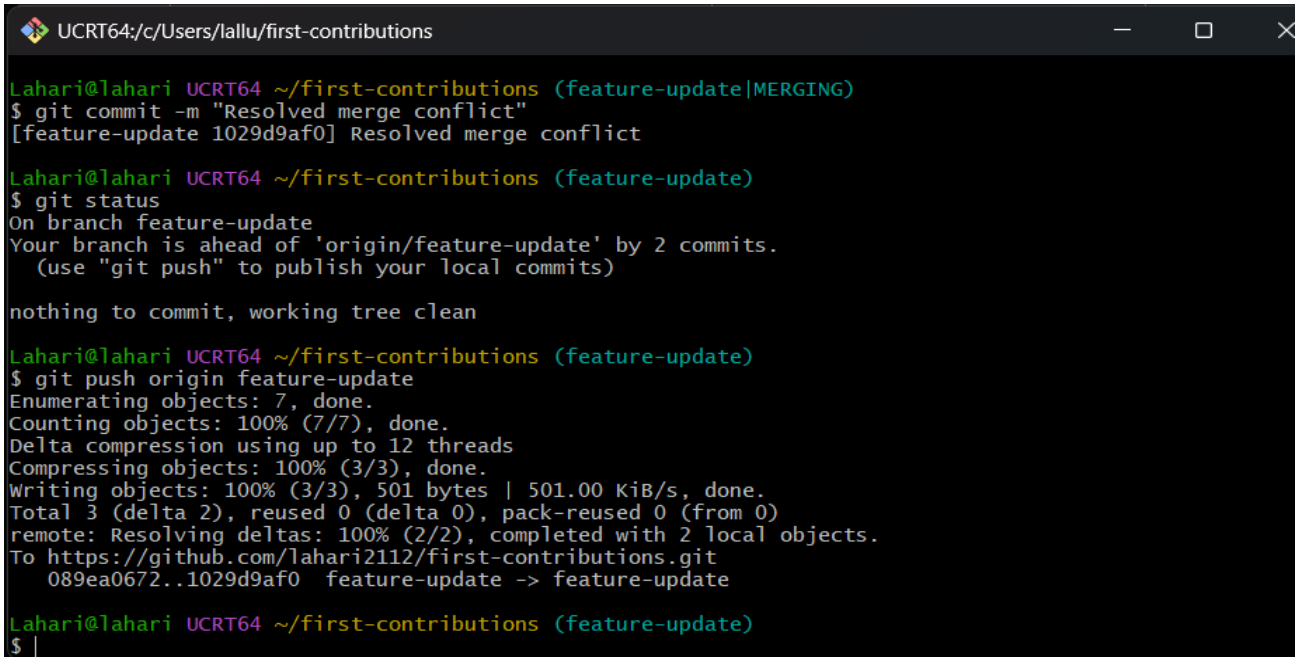

AIM

To work with Git branches while collaborating, merge the main branch into a feature branch, resolve merge conflicts manually, and push the result to GitHub with a pull request.

Procedure:

1. Open Git Bash or the terminal and navigate to the project repository.
2. Initialize a Git repository using git init.
3. Create a new branch using git branch feature.
4. Switch to the new branch using git checkout feature.
5. Make changes to the project files and save them.
6. Stage and commit the changes using:
    - git add .
    - git commit -m "Feature changes"
7. Switch back to the main branch using git checkout main.
8. Make different changes to the same file in the main branch.
9. Commit the changes using git add . and git commit.
10. Merge the feature branch using git merge feature.
11. If a merge conflict occurs, open the conflicting file and manually resolve the differences.
12. Save the corrected file and stage the changes using git add ..
13. Complete the merge using git commit -m "Resolved merge conflict".

Result:

Successfully created and worked with Git branches, performed branch merging, identified merge conflicts, and resolved them manually. The changes were successfully merged into the main branch.
