Experiment-16

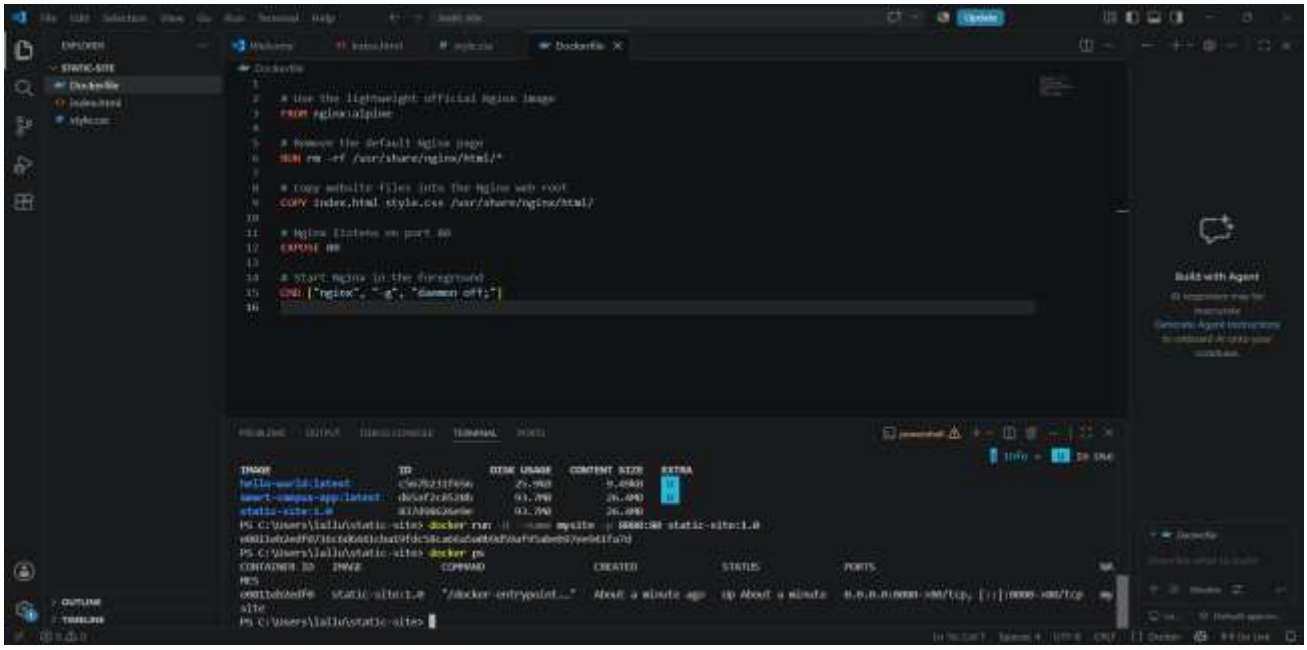

STATIC WEBSITE CONTAINERIZED AND SERVED WITH DOCKER AND NGINX

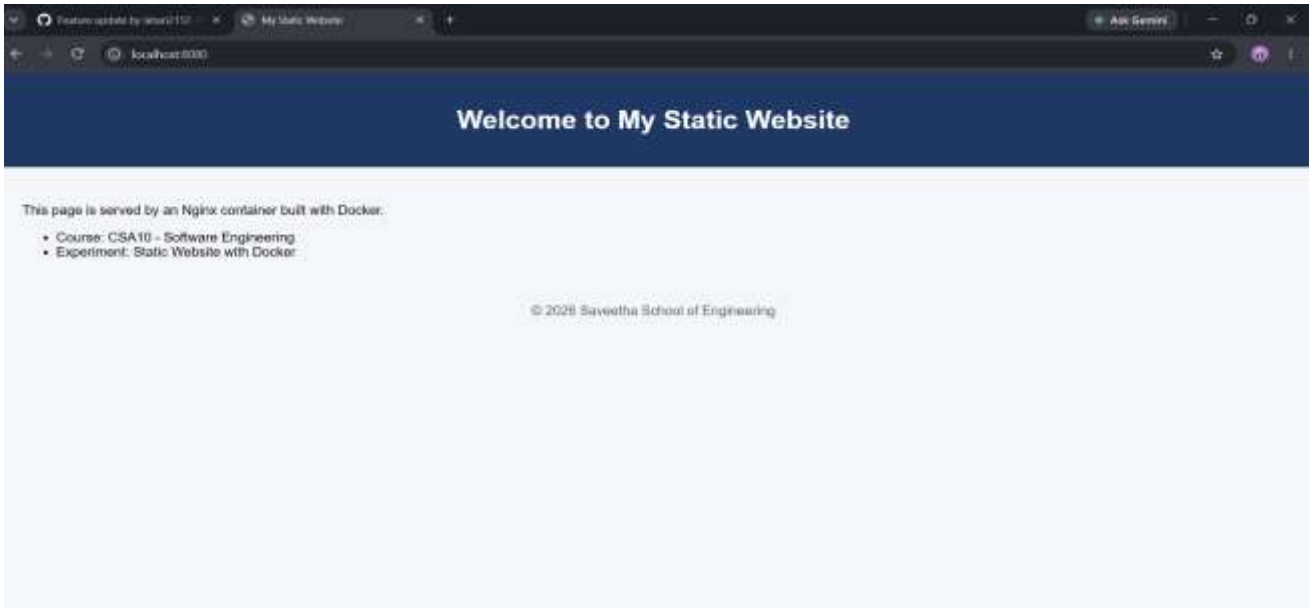

AIM

To create a simple static website, write a Dockerfile that serves it with Nginx, build the Docker image, run the container and access the website from a browser.

Procedure:

1. Install Docker Desktop and start the Docker application.
2. Create a project folder for the static website.
3. Create an index.html file with basic HTML content.
4. Create a Dockerfile to configure the Nginx web server.
5. Add the following instructions to the Dockerfile:
    - Use the Nginx base image.
    - Copy the website files into the Nginx HTML directory.
    - Expose port 80.
6. Open the terminal in the project folder.
7. Build the Docker image using the command: docker build -t my-static-website .
8. Run the Docker container using: docker run -d -p 8080:80 my-static-website
9. Open a web browser and enter http://localhost:8080.
10. Verify that the static website is displayed successfully.

Result:

Successfully created a static website, built a Docker image, and deployed it using an Nginx container. The website was accessed successfully through the browser using the mapped port.
