Experiment-20

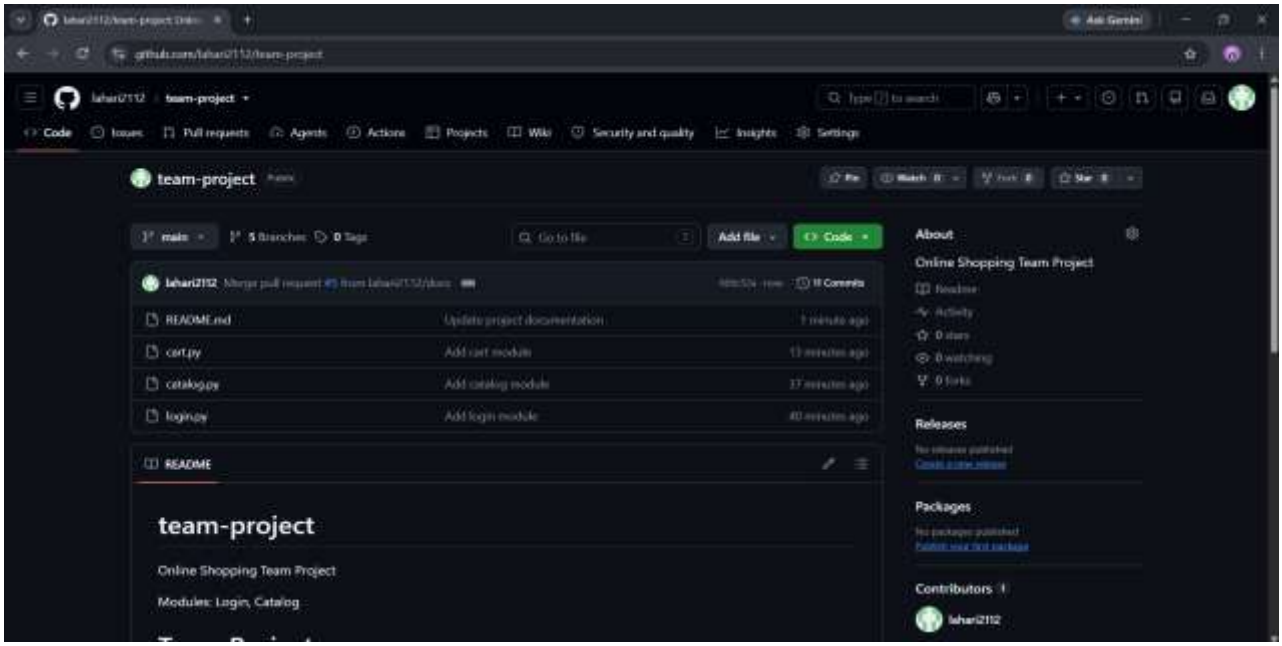

TEAM PROJECT REPOSITORY WITH BRANCHES, PULL REQUESTS AND README DOCUMENTATION

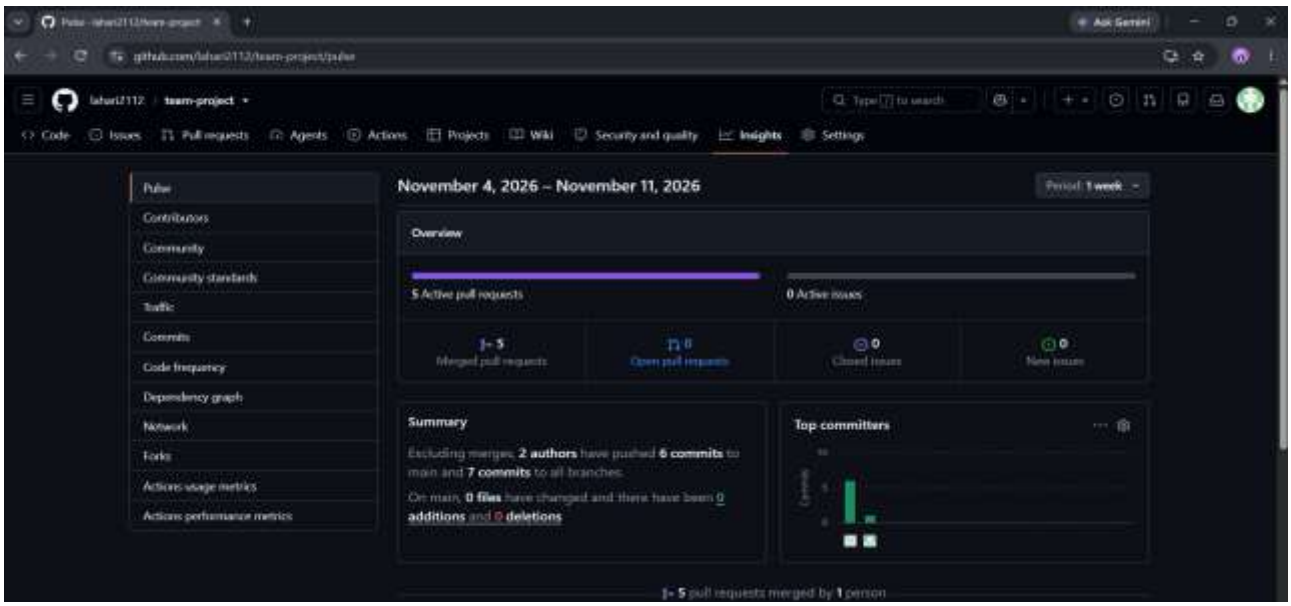

AIM

To set up a GitHub repository for a team project, create branches for individual modules, merge them using pull requests after code review, resolve merge conflicts and document the workflow in the README file.

Procedure

1. Created a team project repository on GitHub.
2. Added project files and initialized the repository.
3. Created separate branches for different team members to work independently.
4. Added and committed changes to the respective branches.
5. Pushed the branches to the GitHub remote repository.
6. Created Pull Requests (PRs) to propose changes from feature branches to the main branch.
7. Reviewed the changes and merged the Pull Requests into the main branch.
8. Created a README.md file containing the project title, description, features, installation steps and usage instructions.
9. Verified the repository, branches, merged Pull Requests and README documentation.

Result

Thus, a team project repository was successfully created on GitHub with separate branches, Pull Requests and README documentation. Team collaboration and version control were performed successfully.
