Experiment-10

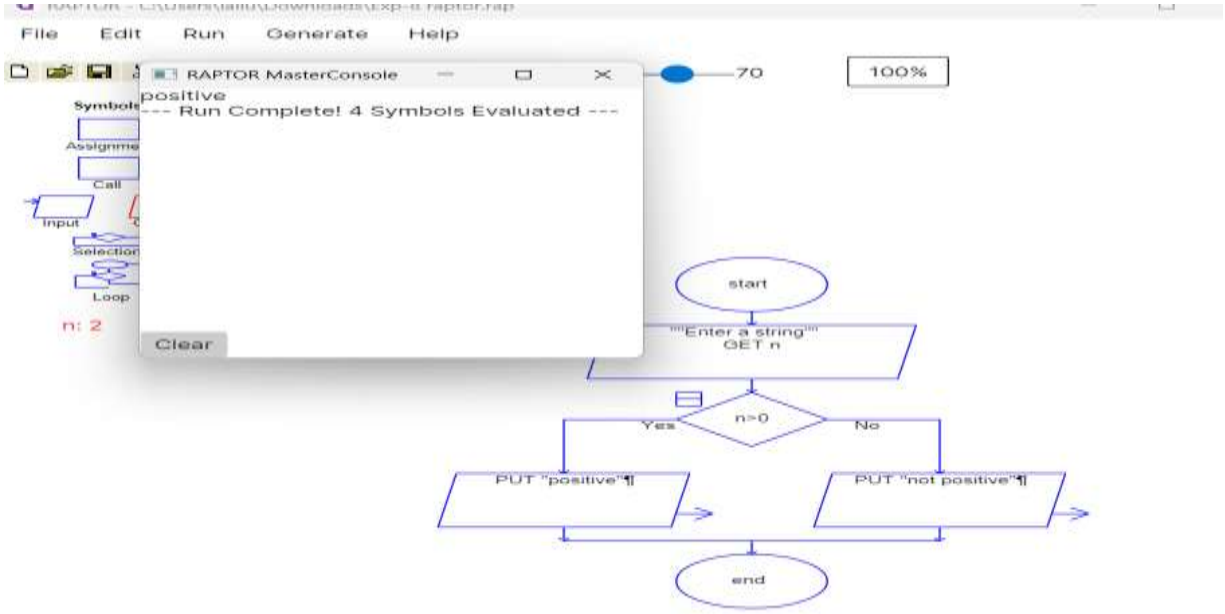

Cyclomatic Complexity of a Flow Graph

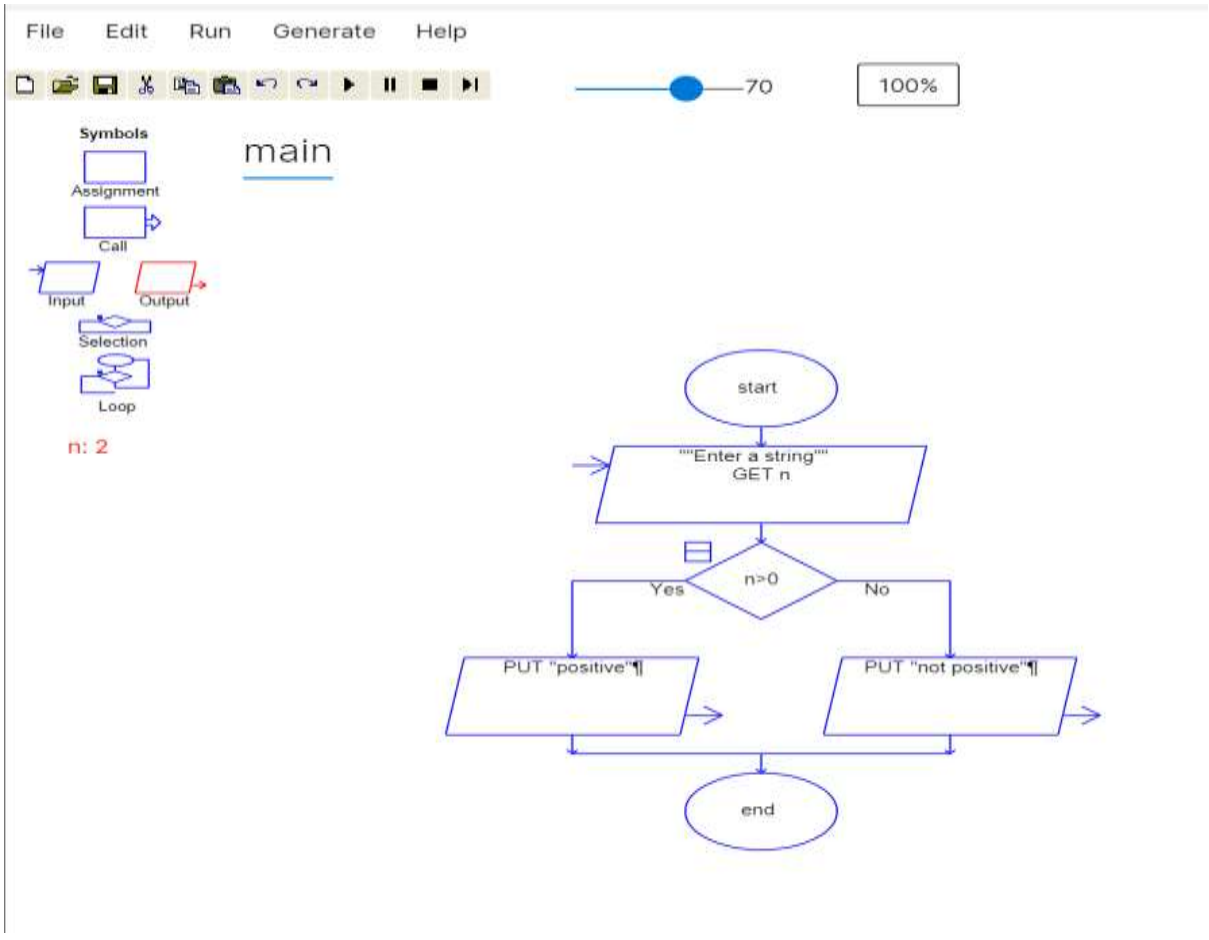

Aim:

To calculate the cyclomatic complexity of a given flow graph using the formula $V(G) = E - N + 2P$.

Procedure:

1. Identify the number of edges (E), nodes (N) and connected components (P) in the flow graph.
2. Note down the given values.
3. Apply the cyclomatic complexity formula $V(G) = E - N + 2P$.
4. Substitute the values in the formula.
5. Calculate and record the cyclomatic complexity.

Result:

The cyclomatic complexity of the given flow graph was successfully calculated using the formula $V(G) = E - N + 2P$.
