

Experiment-4

String Handling Using Raptor

Aim

To design a flowchart using Raptor to display and return the total number of characters present in each string.

Procedure

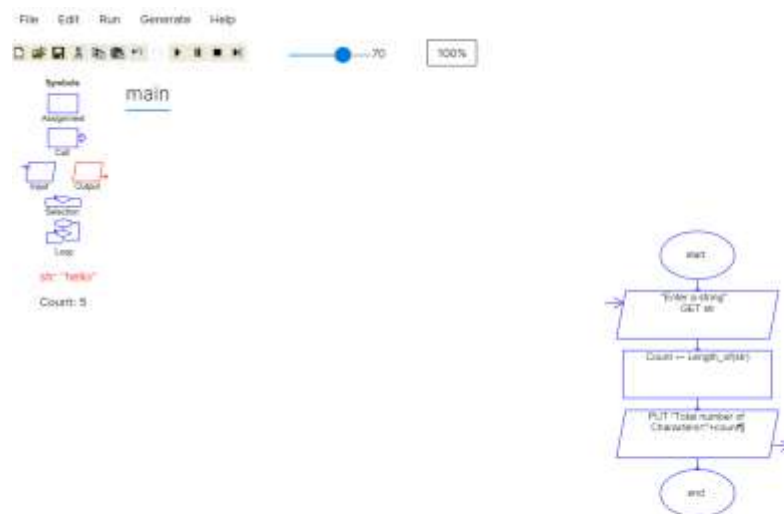

1. Open Raptor and create a new flowchart.
2. Design flowchart steps:
 - Input a string from the user
 - Store the string in a variable
 - Find the length of the string
 - Display the total number of characters
3. Add flowchart logic:
 - Use Input Symbol to accept the string
 - Use Assignment Symbol to calculate character count

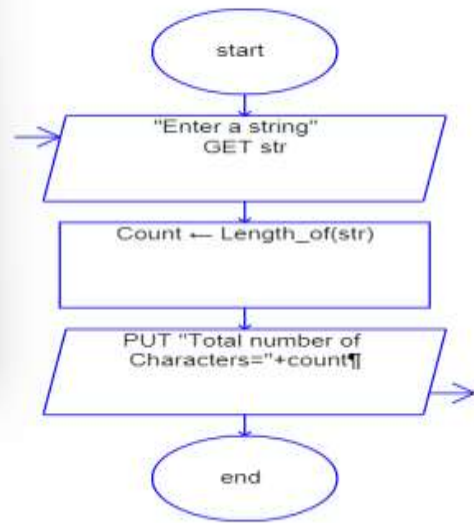

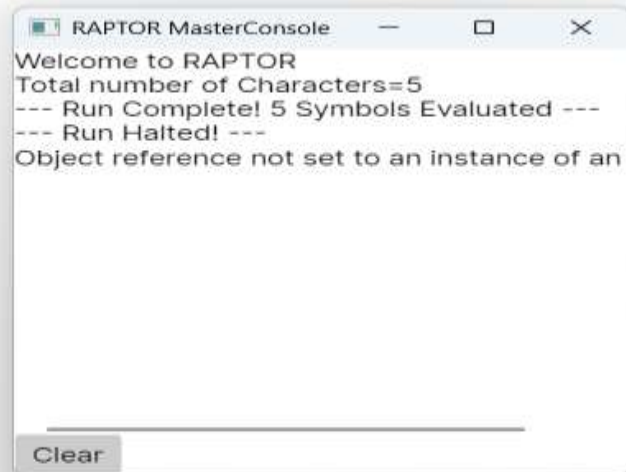

Example:

count $\leftarrow$ Length(str)

- Use Output Symbol to display the count
4. Execute and validate the flowchart using different string inputs.

Output:

Result

Thus, the flowchart for displaying and returning the total number of characters in a string was created and validated successfully using Raptor.
